

ERP Super Admin Console

User & Troubleshooting Guide

Platform Console - Manual SaaS Administration

Purpose of this guide

A practical handbook for the platform owner or Super Admin. It explains what every Super Admin menu does, how tenants, plans, subscriptions, usage and billing relate to each other, and what to check when an action does not work.

Audience	ERP platform owner, SaaS administrator, support lead
Console	/super-admin (separate from tenant ERP)
Operating model	Manual package allocation and lifecycle control; no payment gateway is required for tenant access.
Current guide basis	Current ERP project state - August 2026
Important distinction	Super Admin manages the SaaS platform. Tenant users manage business operations inside their own ERP company.

Golden rule

Do not use the tenant ERP user/role screens to manage platform access. The Super Admin Console uses the separate Platform Admin authentication guard.

1. How to Use This Guide

For a normal task, start with the menu reference. If something is not working, jump to the troubleshooting section and follow the dependency checks in order.

Quick diagnostic rule

When a tenant says “the ERP is blocked”

Check in this order: Tenant status → Subscription status/dates → Plan entitlements → Usage limits → Tenant-side permission/configuration. Billing/payment is not an access prerequisite in the current manual SaaS model.

2. Super Admin Menu Map

Menu	What it is for	Main relationships
Dashboard	Platform-wide operational overview	Tenants, subscriptions, package distribution, expiry/quota alerts, recent activity
Tenants	Create and manage ERP companies	Tenant status, subscription allocation, trial, plan, dates
Subscriptions	Central subscription management	Tenant + plan + billing cycle + lifecycle dates + quick actions
Usage	Monitor package quota consumption	Users, branches, warehouses, products, storage versus plan limits
Plans	Create and edit SaaS packages	Modules/features, limits, pricing metadata, active/default state
Billing	Invoice and manual payment records	Tenant + plan + invoice + payment status; informational/manual

There is no separate “Payment Gateway” menu

The current SaaS design is manual. A Super Admin can activate or renew a tenant without requiring a paid invoice. Billing records can still be generated and manual payments recorded for administration/accounting.

3. Core Concepts and Relationships

Object	Meaning	Example / effect
Tenant	One ERP customer/company	ABC Ltd. Each tenant has isolated ERP data.
Plan	Reusable package definition	Business plan with modules and limits.
Entitlement	A feature/module allowed by the plan	purchasing.module, inventory.module, treasury.module
Limit	Maximum usage allowed by plan	100 users, 25 branches, 50 warehouses, 100,000 products
Subscription	Tenant’s current package allocation	Plan + status + cycle + start/end/trial/period dates
Usage	Actual tenant consumption	34 users of 100, 8 branches of 25
Invoice	Administrative SaaS billing record	Open / Paid / Void / Uncollectible
History	Audit trail of manual subscription changes	Plan assignment, manual update, activate/suspend, quick action

1. Plan

2. Entitlements + limits

3. Subscription allocation

4. Tenant access

5. Usage monitoring

Billing relationship

Invoices and manual payments can be recorded for administration, but billing is separate from subscription access enforcement in the current manual model.

4. Dashboard

Use Dashboard as the platform health screen. It is designed for fast operational checks before opening individual tenant records.

Look for	Tenant counts, subscription health, package distribution, upcoming expiries, quota warnings and recent subscription activity.
Use it when	Starting the day, checking platform health, identifying tenants requiring attention.
Next action	Open Tenants, Subscriptions or Usage for the affected customer.

Dashboard warning does not automatically mean service failure

A near-limit or expiring subscription is an early warning. Open the tenant/subscription record and verify the actual status and dates before changing anything.

5. Tenants

5.1 What the Tenants menu does

Action	Use it for	Important result
View/Search	Find a customer company	Open tenant profile and subscription controls
Create Tenant	Provision a new ERP company	Creates tenant foundation; then assign/configure package as required
Activate	Allow an eligible tenant to operate	Tenant status becomes active
Suspend	Stop tenant access at platform level	Tenant is blocked regardless of normal ERP permissions
Open Tenant	Review complete platform record	Tenant details + subscription + package controls + lifecycle dates

5.2 Recommended tenant onboarding flow

1. Create the tenant with the correct company identity and base settings.
2. Assign an active SaaS plan.
3. Set billing cycle (monthly or annual) and subscription lifecycle dates.
4. Use Trial or Active status as appropriate.
5. Activate the tenant if it should be able to use the ERP now.
6. Open Usage after the tenant starts working to confirm consumption is within limits.

Tenant status and subscription status are related but not identical

A tenant can be administratively suspended even if a plan exists. Always check both before diagnosing access.

6. Plans

Plans define what a tenant is entitled to use and how much of each limited resource the tenant may consume.

Create Plan	Define code, name, description, billing currency/scale, monthly and annual prices, status, default flag and sort order.
Edit Plan	Change package metadata and entitlement values.
Active plan	Can be assigned to tenants.
Inactive plan	Should not be newly allocated.
Default plan	The package intended as the platform default where your provisioning logic uses a default.

6.1 Current module entitlements

Feature key	User-facing meaning
master_data.module	Master Data
purchasing.module	Purchasing / Procurement
sales.module	Sales
inventory.module	Inventory
inventory.advanced	Advanced Inventory
accounts_payable.module	Accounts Payable
accounts_receivable.module	Accounts Receivable
financial_accounting.module	Financial Accounting
treasury.module	Treasury
management_reporting.module	Management Reporting
audit_exports.module	Audit / Export capability

6.2 Current usage limits

Limit key	Controls	Blank enabled value
users.limit	Maximum tenant users	Unlimited
branches.limit	Maximum branches	Unlimited
warehouses.limit	Maximum warehouses	Unlimited
products.limit	Maximum products	Unlimited
storage_mb.limit	Tenant storage quota in MB	Unlimited

Important

If an enabled limit is left blank, it means unlimited. Do not enter 0 unless you intentionally want the configured behavior for zero in your plan rules.

6.3 When a plan appears to have no feature controls

Symptom

Create/Edit Plan shows no entitlement rows or saving reports that entitlements are required.

1. Confirm the SaaS feature catalog exists in the database.
2. For a fresh environment, run the project SaaS plan/feature seeder according to deployment instructions.
3. Reload the Plans screen and confirm all feature/limit rows appear before saving.

7. Subscriptions

Subscriptions are the central connection between a Tenant and a Plan. Use this menu when managing package allocation, lifecycle status or dates across many tenants.

Field	Meaning	Operational note
Plan	Package assigned to tenant	Only an active plan should be allocated.
Billing cycle	Monthly or annual	Used for package/billing metadata.
Status	trial / active / past_due / suspended / cancelled	Controls lifecycle state.
Starts at	Subscription start date and time	Required.
Trial ends at	Trial expiration	Required when status is Trial.
Current period start/end	Current service period	End must be after start.
Past due at	When subscription became overdue	Required for Past Due.
Grace ends at	End of grace period	Required for Past Due and after past-due time.
Ends at	Final subscription end	Optional; must not precede start.

Date AND time are supported

The Super Admin subscription controls use explicit date and time inputs. This matters for exact expiry/grace cutoffs, especially when tenants operate in different time zones.

7.1 Subscription statuses - quick meaning

Status	Use when	What to check
Trial	Customer is evaluating/onboarding	Trial end date
Active	Customer is allowed under normal subscription rules	Current period/end date if used
Past Due	Administrative overdue state with grace handling	Past-due date + grace end
Suspended	Access should be blocked at subscription level	Reason/context before reactivation
Cancelled	Subscription has ended	End date and replacement plan if reactivating

7.2 Quick actions

Quick action	Typical use
Extend Trial +7 days	Short trial extension
Extend Trial +14 days	Standard additional evaluation period
Extend Trial +30 days	Longer evaluation/onboarding period
Extend +1 Month	Add one month to subscription period
Extend +1 Year	Add one year to subscription period
Renew Monthly	Set/renew a monthly service period
Renew Annual	Set/renew an annual service period
Activate Indefinitely	Make active without a finite current-period end

Quick actions are manual platform controls

They do not require an invoice or payment gateway. Use them only when the commercial/administrative decision has already been made.

8. Usage

Usage compares a tenant's actual resource consumption with the limits defined by the assigned plan.

State	Meaning	Recommended action
Healthy	Comfortably below limit	No action
Near Limit	Approaching package cap	Contact/plan upgrade or cleanup
At Limit	Exactly at package cap	New resource creation may be blocked
Over Limit	Consumption exceeds current limit	Investigate immediately; plan may have been downgraded
Unlimited	No numeric cap	Monitor for operational capacity only
Not Included	Feature/resource is not part of plan	Change plan/entitlement if needed
No Subscription	Tenant has no usable subscription record	Assign/fix subscription

Common support case: “Cannot create another user/branch/product”

Open Usage first. If the resource is At Limit or Over Limit, changing tenant-side permissions will not solve the package-limit problem.

9. Billing

Billing keeps SaaS invoices and manual payment records. In the current project it is an administrative record, not the gatekeeper for subscription access.

Invoice status	Meaning
Open	Amount remains due
Paid	Balance has been fully recorded as paid

Invoice status	Meaning
Void	Invoice is cancelled/voided
Uncollectible	Amount is not expected to be collected

1. Tenant + Plan

2. Generate invoice

3. Invoice Open

4. Record manual payment if applicable

5. Invoice Paid

Access rule

An Active subscription does NOT require a paid invoice. Do not suspend a tenant automatically just because Billing shows an open invoice unless that is your explicit business decision and you update the subscription/tenant status manually.

10. Subscription History & Audit Trail

The subscription history screen reuses the system audit trail to show important SaaS lifecycle changes. Use it when you need to answer “who changed this tenant, what changed, and when?”

- Plan assignment/change
- Manual subscription update
- Manual activation
- Manual suspension
- Quick-action renewal/extension
- Old and new values where available

Support practice

Before correcting a surprising subscription state, check History. It may reveal that a plan, status or date was intentionally changed by another Super Admin.

11. Common Super Admin Workflows

11.1 New customer onboarding

1. Create Tenant

2. Assign Plan**3. Set Trial/Active****4. Set exact dates****5. Activate Tenant****6. Verify tenant login/Usage**

11.2 Upgrade or downgrade package

1. Open Tenant/Subscriptions**2. Review current Usage****3. Choose active Plan****4. Save allocation****5. Re-check Usage****6. Review History**

Before downgrading

Check current Usage against the new lower limits. A tenant can become Over Limit immediately after a downgrade even though existing records are still present.

11.3 Manual renewal

1. Open Subscription**2. Review current status/end****3. Choose Renew Monthly/Annual****4. Confirm new period****5. Check Active status****6. History records action**

11.4 Temporary suspension and return

12. Troubleshooting - “Why Is It Not Working?”

Symptom	Check first	Likely fix
Tenant cannot access ERP	Tenant status + subscription status	Activate tenant / correct subscription lifecycle
Menu/module missing inside tenant ERP	Plan entitlement	Assign a plan that includes the module or enable entitlement in appropriate plan
Tenant cannot create more users/branches/products	Usage state and plan limit	Increase limit / upgrade plan / reduce usage
Plan cannot be assigned	Plan status	Activate the plan
Trial save fails	Trial end date	Enter trial_ends_at later than starts_at
Past Due save fails	Past-due and grace dates	Set past_due_at and grace_ends_at correctly
Subscription dates rejected	Date ordering	Period end after start; ends_at not before starts_at
Billing invoice is Open but tenant works	Current manual model	This is expected unless you manually change tenant/subscription status
No entitlement rows on Plan form	Feature catalog/database seed	Load SaaS plan/features seed and reload
Flash/success message not visible	UI/session refresh issue	Reload once; verify action by checking resulting status/history

12.1 Master diagnostic flow

Do not skip layers

A tenant-side role permission cannot override a missing SaaS entitlement or a platform suspension. Likewise, changing the plan will not fix a tenant-side setup problem such as Document Numbering, product locations or accounting configuration.

13. Is This a Super Admin Issue or a Tenant ERP Issue?

If the problem is about...	Usually check...	Console
Tenant/company blocked	Tenant + Subscription	Super Admin
A whole module is missing	Plan entitlement	Super Admin
Cannot add user/branch/product because quota reached	Usage limit	Super Admin
PO cannot Submit because no Document Numbering	Document Numbering for tenant branch	Tenant ERP
Product does not appear in PO Order Lines	Product Branch/Warehouse configuration	Tenant ERP
User sees module but cannot click action	Role/permission	Tenant ERP
Accounting period/document setup error	Accounting/Administration configuration	Tenant ERP
Invoice/payment record for SaaS subscription	Billing	Super Admin

Example

A Purchase Order can fail to submit because its branch has no active Purchase Order Document Numbering sequence. That is NOT fixed from Super Admin. Open the affected tenant ERP and configure Administration → Organisation → Document Numbering.

14. Support Checklist Before Changing Anything

- ☐ Confirm the tenant/company name and code.
- ☐ Confirm whether the issue affects every tenant user or only one user.
- ☐ Check Tenant status.
- ☐ Check Subscription status and exact date/time fields.
- ☐ Confirm the assigned Plan is active.
- ☐ Confirm the required module entitlement is included.
- ☐ Check Usage for At Limit / Over Limit / Not Included.
- ☐ Check Subscription History for recent changes.
- ☐ Only then move to tenant ERP configuration/permissions if platform checks are healthy.
- ☐ After any manual change, verify the resulting state rather than relying only on the success toast.

15. Recommended Super Admin Routine

Daily / frequent checks

- Dashboard: expiry warnings, suspended/past-due tenants, quota alerts.
- Subscriptions: recent manual changes and tenants needing renewal.
- Usage: near-limit and over-limit customers.
- Billing: open invoices requiring administrative follow-up, if your business uses the billing records.

Before plan changes

- Review affected tenant usage.
- Confirm entitlement keys and limits.
- Avoid deactivating a plan that is still operationally required without understanding impact.
- Review Subscription History after major package changes.

16. Security & Data-Isolation Notes for Operators

Separate consoles

The Super Admin Console is a platform-level control plane. Tenant ERP data belongs to each tenant and remains isolated. Do not share Super Admin credentials with tenant staff.

- Use Super Admin only for platform/tenant lifecycle tasks.

- Use tenant ERP accounts for business transactions and tenant configuration.
- Treat Suspend/Cancel/Plan downgrade as high-impact actions.
- Review History when investigating unexpected changes.

17. Quick Glossary

Platform Admin	Operator of the SaaS control plane.
Tenant	Customer/company using an isolated ERP environment.
Entitlement	Feature/module permission granted by the SaaS plan.
Limit	Plan quota for a measurable resource.
Subscription	Tenant-to-plan allocation with lifecycle state and dates.
Quick Action	Manual shortcut for trial extension, renewal, period extension or indefinite activation.
Past Due	Lifecycle state that requires past-due and grace dates.
Usage	Current tenant resource consumption measured against plan limits.
Manual Payment	Payment record entered by Super Admin; no automated payment gateway is required.

18. One-Page Decision Guide

User says...	Go here first
"Our whole ERP is blocked."	Super Admin → Tenants / Subscriptions
"We cannot see Purchasing/Sales/Treasury."	Super Admin → Plans + tenant Subscription
"We cannot create another user/branch/product."	Super Admin → Usage
"Please extend our trial."	Tenant detail / Subscriptions → Trial quick action
"Please renew for one month/year."	Subscriptions → Renew Monthly / Renew Annual
"Please give access without an end date."	Subscriptions → Activate Indefinitely
"Invoice is unpaid; why can they still log in?"	Expected in manual model; Billing does not automatically gate access
"Purchase Order will not submit."	Usually tenant ERP configuration; check Document Numbering, not Super Admin
"Product is missing from Purchase Order."	Tenant ERP Product → Locations; check branch/warehouse settings

Final rule

Super Admin answers "Can this tenant use this package/resource?" Tenant ERP answers "Is this company's business process configured correctly?" Check the correct layer first.
